SPRAY FOAM INSULATION IN RIM JOIST

NO AIR GAPS AROUND OUTLETS

POLAR BLANKET INSULATION IN GARAGE CEILING

Fiberglass Blown-in Insulation Systems, also known as the Polar Blanket, is one of the latest green building techniques used by Renaissance Homes.

This system improves a home's efficiency by filling the wall cavity completely, including the areas around pipes, cables and outlets.

Polar Blanket gets into all of the voids where traditional insulation can't protect, creating a "blanket" of insulation and making a more energy efficient home.

The Polar Blanket decreases air going through the wall cavity as it is applied as a dense pack application.

The R-Value of Polar Blanket is 23 and significantly helps reduce monthly utility costs by reducing air infiltration through the cavity walls.
